~ 4 % side-on

COORDINATION MOTIFS FOR DPPA BRIDGED METAL COMPLEXES^[I-III]

The slightly modified *Templeton*^[III] acetylene complex 1 serves as a precursor for the synthesis of bisphosalkyne complexes 3. Stepwise introduction of the functionalities at -78 °C allows the formation of otherwise unstable electron rich alkynes directly on the metallacyclopropane moiety. Variation of the electrophile, which are not limited to phosphorus chlorides, leads to unsymmetric substituted alkyne complexes.

Tris(trimethylpyrazolyl)borate

- anionic
- tripodal chelating ligand
- protected from S_e (unlike Tp*)

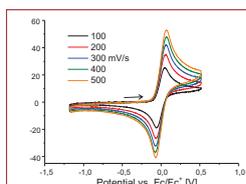

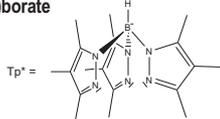

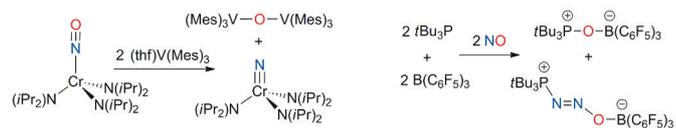

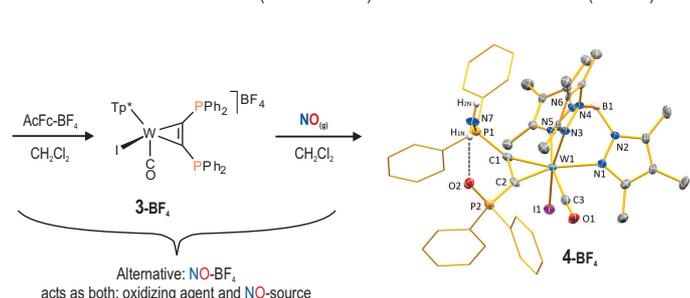

Fig. 1 CV of 3 at different scan rates.

- reversible oxidation wave at -5 mV
- *in situ* IR spectra reveal a strong CO shift from 1930 to 2079 cm⁻¹
- 3-BF₄ can be crystallized at -30 °C, otherwise it will disproportionate

Redoxchemistry and NO Splitting

TRANSITION METAL COMPLEX (C.C.Cummins)^[IV]

OPEN FLP SYSTEM (G.Erker)^[V]

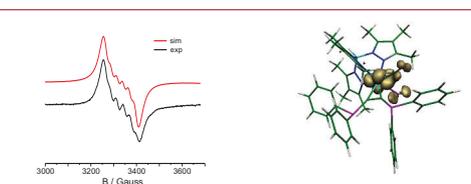

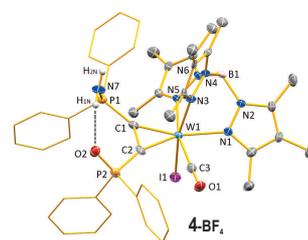

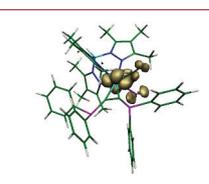

Fig. 2 EPR spectra of 3* at rt. in CH₂Cl₂ / thf.

- EPR shows isotropic signal for 3* with ¹⁰¹I (5/2, 100%) hyperfine coupling
- notable absence of ³¹P (1/2, 100%) hyperfine coupling
- calculated spin density of 3* is mainly located at W with some contributions at I and small contributions at CO
- oxidation is considered to be a metal centred redox process (W^{IV} → W^{III})

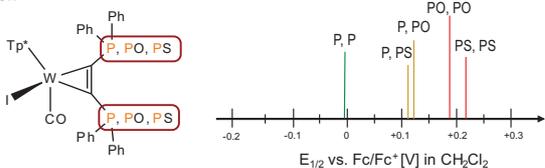

Selected bond lengths [Å]

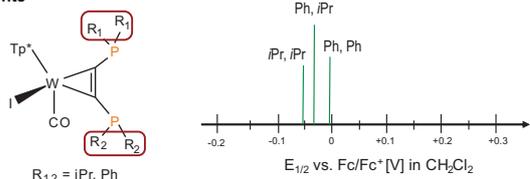

| | 3 | 4-BF ₄ |
|-------|----------|-------------------|
| W1-C1 | 2.036(2) | 2.036(5) |
| W1-C2 | 2.057(2) | 2.047(5) |
| W1-C3 | 1.966(2) | 1.985(5) |
| W1-I1 | 2.789(1) | 2.774(1) |
| C1-C2 | 1.335(3) | 1.322(7) |
| C1-P1 | 1.790(2) | 1.770(5) |
| C2-P2 | 1.802(2) | 1.825(5) |
| P1-N7 | — | 1.609(5) |
| P2-O2 | — | 1.487(4) |
